## carotid hyperperfusion syndrome

A. Ross Naylor MD, FRCS
Professor of Vascular Surgery
Leicester Vascular Institute
Leicester UK
arnaylor@hotmail.com

# I have no disclosures relating to this talk

## hyperperfusion syndrome (HS)

constellation of symptoms including; headache, seizures, impaired consciousness, neurological deficit secondary to either ischaemia or intracranial haemorrhage

uncontrolled surges in blood flow after CEA/CAS, but complex relationship with post-CEA hypertension

meta-analysis: 3.4% after CEA vs 2.2% after CAS (OR 1.43 (95%CI 1.01-1901), p=0.015), Galyfos J Neurol Sci 2017

risk factors: bilateral severe ICA disease, impaired autoregulation, poorly controlled BP, impaired cerebral vascular reserve, poor collateralization via circle of Willis

## clinical symptoms

**REVIEW** 

**EJVES 2011;41:229** 

## Hypertension and the Post-carotid Endarterectomy Cerebral Hyperperfusion Syndrome [CME]

S. Bouri, A. Thapar, J. Shalhoub, G. Jayasooriya, A. Fernando, I.J. Franklin, A.H. Davies\*

	Hyperperfusion Syndrome (n=42)	Intracranial Haemorrhage (n=36)
seizures	36%	31%
hemiparesis	31%	31%
both	33%	31%

## onset of symptoms

REVIEW

EJVES 2011;41:229

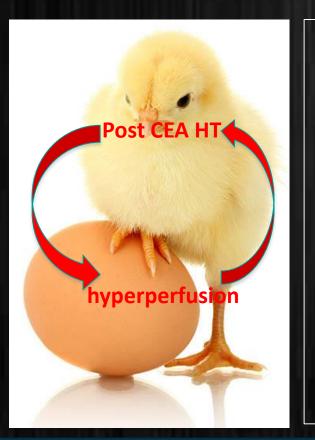

## Hypertension and the Post-carotid Endarterectomy Cerebral Hyperperfusion Syndrome [CME]

S. Bouri, A. Thapar, J. Shalhoub, G. Jayasooriya, A. Fernando, I.J. Franklin, A.H. Davies\*

median delay = 5 days (IQR 3-6)
92% had onset of HS symptoms within 1 week
earliest presentation = 17 hours
latest presentation = 28 days

## Hypertension and the Post-carotid Endarterectomy Cerebral Hyperperfusion Syndrome [CME]

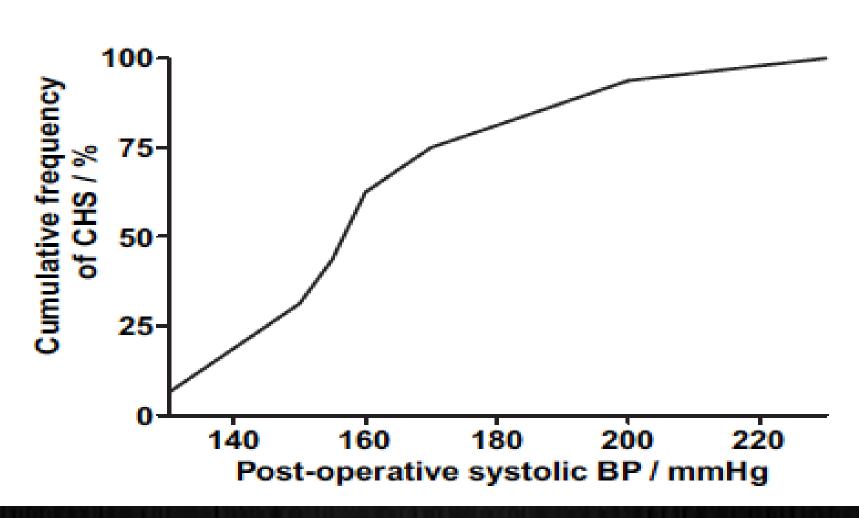

S. Bouri, A. Thapar, J. Shalhoub, G. Jayasooriya, A. Fernando, I.J. Franklin, A.H. Davies\*

81% of HS/ICH patients had severe HT 'at onset' of symptoms *Bouri EJVES 2011* 

BUT some are normotensive Naylor EJVES 2003

rapid treatment of post-CEA HT can reverse headache/seizures and prevent progression on to HS stroke or ICH Naylor EJVES 2013

## factors associated with PEH?

### significant association

Pre-op undiagnosed / poorly controlled hypertension

baroreceptor dysfunction

Intra-op severe hypertension on induction of anaesthesia

### **NOT** Associated with PEH

#### Pre-op

Impaired autoregulation
Presenting symptoms
Time since index event

Timing of surgery

Central aortic pressure
Degree of carotid stenosis

Diabetes Mellitus antihypertensive

PVD

heart disease

smoking

NIHSS score raised lipids

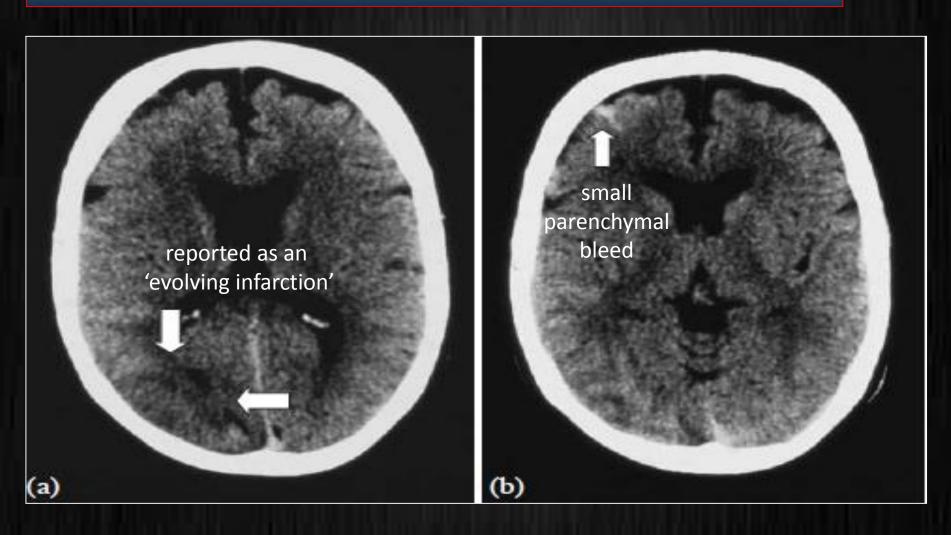

MCAV class of

Intra-op

Induction agents Vasoactive agents post-clamp MCAV

intra-op BP

## beware of 'evolving infarction' diagnosis

Naylor EJVES 2003;26:39

## anomalies

if this is mainly a high-flow phenomenon, how does an increase in CBF cause severe hypertension?

if autoregulation is defective pre-operatively, why do most CEA patients have a surge in MCAV after clamp release, which then declines over the next 10 minutes, suggesting that autoregulation is intact?

if this is purely a high flow phenomenon with abnormal auto-regulation, why are there not consistently large increases in MCAV at restoration of flow or at 3 hours post clamp release in patients destined to develop HS?

## anomalies

if this is a high-flow pathology, why have studies found no CBF increase when some patients became symptomatic?

how does HS/HE account for patchy white matter oedema where CBF is either normal or increased?

if cerebral oedema is such an important factor in triggering onset of seizures, why do some patients exhibit this abnormality predominantly in the posterior (rather than in the carotid) circulation?

## possible pathopysiology

extravasation of protein and vasogenic oedema consistent with breakthrough of the autoregulation mechanism, rather than being secondary to true ischaemia

absent autoregulation, fuelled by worsening hypertension, increases CBF; aggravating microcirculatory changes with increasing breakdown of blood brain barrier

impairment of endothelial permeability, activation of coagulation cascade and inhibition of endogenous fibrinolysis, leading to either intravascular thrombosis (ischaemic stroke) or intracerebral haemorrhage

## can 'high-risk' patients for HS be predicted?

## YES

Prediction of Cerebral Hyperperfusion after Carotid Endarterectomy with Transcranial Doppler

C.W.A. Pennekamp <sup>a</sup>, S.C. Tromp <sup>b</sup>, R.G.A. Ackerstaff <sup>b</sup>, M.L. Bots <sup>c</sup>, R.V. Immink <sup>d</sup>, W. Spiering <sup>e</sup>, J.P.P.M. de Vries <sup>f</sup>, L.J. Kappelle <sup>g</sup>, F.L. Moll <sup>a</sup>, W.F. Buhre <sup>d</sup>, G.J. de Borst <sup>a,\*</sup>

## NO

Changes in Middle Cerebral Artery Velocity after Carotid Endarterectomy do not Identify Patients at High-risk of Suffering Intracranial Haemorrhage or Stroke due to Hyperperfusion Syndrome

J.E. Newman a,\*, M. Ali a, R. Sharpe b, M.J. Bown a, R.D. Sayers a, A.R. Naylor a

## can HS stroke/ICH be prevented?

measuring MCAV changes with flow restoration ineffective

vast majority of HS/ICH patients have post-CEA hypertension

"needs of the many outweigh the needs of the few"!

## Guidelines for treating post-CEA hypertension

#### GUIDANCE FOR THE MANAGEMENT OF POST-CAROTID ENDARTERECTOMY HYPERTENSION

#### (1) THEATRE RECOVERY: systolic BP >170mmHg

#### **General Points**

Is the patient in urinary retention or in pain?

Has the patient received their normal anti-hypertensive medication today?

#### First line

#### LABETALOL

100mg Labetalol in 20 mls of 0.9% Saline. (ie. 5mg per ml)

Give 10mg (2 ml) boluses slowly every two mins up to 100mg (ie 20mls given over 20mins)

If BP remains elevated after 20 mins, move to second line agent. If BP reduces and does not rebound, continue regular BP observations.

If BP reduces but increases again, start infusion at 50-100mg per hour, titrating dose to BP.

Patient remains in PACU/HDU while Labetalol infusion is running. Following cessation of the infusion, the patient should remain in PACU/HDU for 2 further hours to minimise rebound hypertension.

#### Second line

#### HYDRALAZINE.

10mg Hydralazine in 10mls of 0.9% Sodium Chloride (ie 1mg per ml)

Give 2mg (2ml) boluses slowly every 5 mins up to 10mg (ie 10mls given over 25 mins)

If BP remains elevated after 25 mins, move to third line agent. If BP reduces and does not rebound, continue regular BP observations.

If BP reduces but increases again, move to third line agent

Patient remains in PACU/HDU while Hydralazine therapy is underway. Following cessation of Hydralazine therapy, the patient should remain in PACU/HDU for 2 further hours to minimise rebound hypertension.

#### Third Line

50mg GTN in 50mls 0.9% Sodium Chloride (ie 1mg per ml) start infusion at 5mls/hr (5mg/hr), increasing rate to 12mls/hr (12mg/hr), titrated to BP.

Patient remains in PACU/HDU while GTN infusion is underway. Following cessation of GTN infusion, the patient should remain in PACU/HDU for 2 further hours to minimise rebound hypertension

#### (2) PATIENT IS BACK ON THE WARD:

#### systolic BP >170mmHg, but NO headache/neurology

There are three scenarios:

- (1) Patient is not normally on antihypertensive therapy
- (2) Patient is normally on antihypertensive therapy
- (3) Patient cannot swallow tablets

#### (2.1) Patient is NOT normally on antihypertensive therapy

Nifedipine Retard (10mg), repeated after 1 hour if no change in BP.

DO NOT use crushed Nifedipine capsules

If no reduction in BP, move to second line agent

#### Second line

Bisoprolol 5.0mg.

If contra-indicated, move to third line agent.

Ramipril 5mg, repeated at 3hrs if necessary

contact Hypertension Specialists for clinical review

#### (2.2) Patient IS normally on antihypertensive therapy

Check the patient has received normal anti-hypertensive medication. If not, administer this.

A = ACE inhibitor, B = B-Blocker, C = Calcium Channel Blocker, D = Diuretic

If patient is on A, add in C (Nifedipine LA 10mg) If patient is on C, add in A (Ramipril 5mg) If patient is on D, add in A (Ramipril 5mg)

If patient is on A+C, add in D (Bendrofluazide 2.5mg) If patient is on A+D, add in C (Nifedipine LA 10mg) If patient is on A+C+D, add in B (Bisoprolol 5mg)

contact Hypertension Specialists for clinical review

#### 2.3 Patient cannot swallow tablets

Pass nasogastric tube and administer appropriate medicines in liquid form as prescribed above. In this situation, Amlodipine should replace Nifedipine

#### (3) PATIENT IS BACK ON THE WARD:

#### systolic BP >160mmHg + headache/seizure or deficit

- ✓ Treatment should start IMMEDIATELY on the ward using non-invasive monitoring.
- ✓ Anti-hypertensive protocol is the same as used in Recovery (see below)
- ✓ On call surgical SpR/SHO must:
  - 1. Contact on call consultant vascular surgeon to inform him of increase in BP associated with seigure/ headache or onset of neurological deficit.
  - 2. Contact on call ITU SpR to arrange urgent transfer to SACU, HDU or PACU for invasive arterial BP monitoring
  - 3. Administer 8mg Dexamathasone intravenously

#### First line

#### LABETALOL

100mg Labetalol in 20 mls of 0.9% Saline. (ie. 5mg per ml)

Give 10mg (2 ml) boluses slowly every two mins up to 100mg (ie 20mls given over 20mins)

If BP remains elevated after 20 mins, move to second line agent.

If BP reduces and does not rebound, continue regular BP observations.

If BP reduces but increases again, start infusion at 50-100mg per hour, titrating dose to BP.

#### Second line

#### HYDRALAZINE.

10mg Hydralazine in 10mls of 0.9% Sodium Chloride (ie 1mg per ml)

Give 2mg (2ml) boluses slowly every 5 mins up to 10mg (ie 10mls given over 25 mins)

If BP remains elevated after 25 mins, move to third line agent

If BP reduces and does not rebound, continue regular BP observations.

If BP reduces but increases again, move to third line agent

#### Third Line

50mg GTN in 50mls 0.9% Sodium Chloride (ie 1mg per ml)

start infusion at 5mls/hr (5mg/hr), increasing rate to 12mls/hr (12mg/hr), titrated to BP.

Following transfer, patient remains in SACU, PACU or HDU while anti-hypertensive treatment ongoing. Following cessation of treatment, the patient should remain in SACU, PACU or HDU for a minimum of 6 further hours to minimise rebound hypertension.

The following Hypertension Specialists have agreed that they can be contacted via their mobile phones for advice within working hours Professor Bryan Williams 07747 614 288

Dr Adrian Stanley

### GUIDANCE FOR THE MANAGEMENT OF POST-CAROTID ENDARTERECTOMY HYPERTENSION

### (I) THEATRE RECOVERY: systolic BP >170mmHg General Points

In the present as sureary extremion or as point?

Has the patient received their scennel and hypertrenies medication molec?

#### First line

#### LABETALOL

100mg Labetalol in 20 mb of 0.9% Saline. (a. 5mg per roll) Give 10mg (2 ml) behases along every two mins up to 100mg (a 20mle given over 20mins).

If BP remains elevated after 20 mins, move to second fine agent. If BIP reduces and does not rebound, continue tegodar BIP observations

If BP reduces but increases again, stars infusion at 50-100mg per hour, torstong done to BP Partiest remains in PACU/HDU which Laborated implesion is removing Federatey accounts of the explainer, the partiest should remove in PACLIFEDU for 2 factor from 20 removes released beginning

#### Second line

#### HYDRALAZINE

10mg Hydrakame in 10mls of 0.9% Seelium Chloride (a 1mg per mi) Gree 2mg (2mg) boluses slowly every 5 mins up to 10mg (in 10mle green over 25 mins) If BP remains clevated after 25 mins, move to third line agent. If RP seduces and close nor rebound, continue regular RP observations If \$3° andrews but increases again, move to third her agent

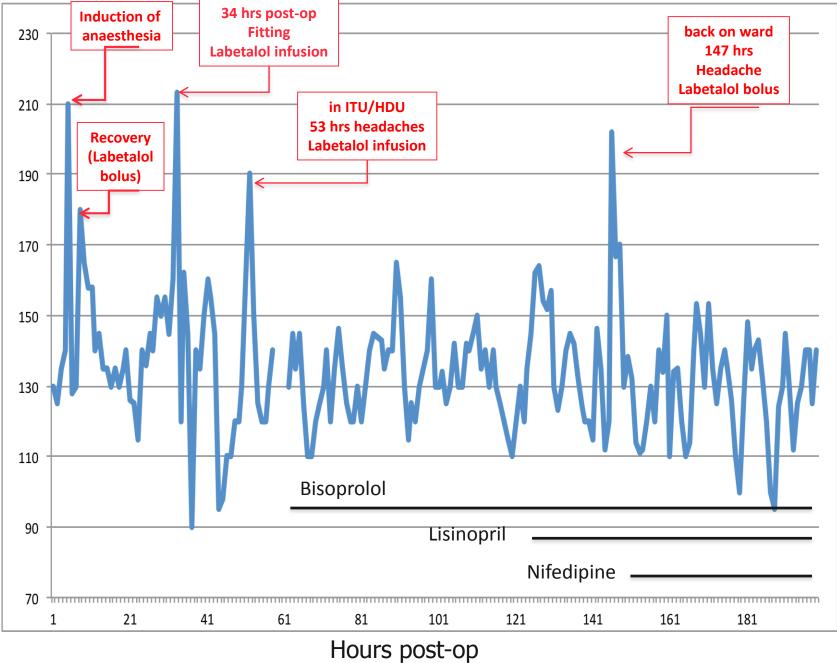

Patient remains in PACU/HDU while Hydralicies through it and/ways, Fachanting armston of Hydralicies though, the partiest about a remain in PACU/HDU for 2 horder have to make released becomes

#### Third Line

Sting GTN in Shink 0.5% Sodium Chloride in long you relstars astument at Smily he (Sings Be), increasing rare to 12mls, he (12mg Be), attented to 200

Patient remarks in P.-ACD/HDU while GTN implease it analonessy. Nathway common of GTN replaces, the partiest should remain in Total 1/1/2000 for 2 facility have a manage value of parties of
